

PROJECT OVERVIEW

MedSight

Medicine identification for people who are blind or have low vision

THE PROJECT

A team project for our AI course. The user points their phone at a medicine box, and the app identifies the medicine and reads it aloud.

Stack: Expo / React Native + TypeScript · Python back end · Groq vision AI

My role: I built the front end and integrated it with the back end and AI service. I host the server and own testing, documentation, and new features.

ACCESSIBILITY-FIRST DESIGN

- **Spoken guidance** while scanning, like "Move closer", plus haptic feedback.
- **Never colour alone:** every status pairs an icon with words ("Verified" / "Not verified").
- **Large touch targets** and a high-contrast dark theme.
- **Atkinson Hyperlegible**, a font designed for low-vision readers.
- **Screen-reader labels** on every control.

App screens

Each screen is built to be usable without relying on sight.

Scan

A framing guide and spoken prompts help the user aim, with one large Scan button.

History

Past scans, with status shown by icon and text. Unrecognised medicines are flagged.

My medicines

The user's saved medicines, added by scanning a box once.

Voice

Choose the text-to-speech voice and tap any option to hear a preview.
